Chapter 12 Mass Storage Structure

Outline

- **Disk Structure**
- **Disk Attachment**
- **Disk Scheduling**
- **Disk Management**
- **Swap-Space Management**
- **RAID Structure**
- **Stable-Storage Implementation**
- **Tertiary Storage Devices**

Disk Structure

Disk Structure

- Magnetic disks provide bulk of secondary storage of modern computers
 - **Transfer rate** is rate at which data flow between drive and computer
 - **Positioning time** (random-access time) is time to move disk arm to desired cylinder (**seek time**) and time for desired sector to rotate under the disk head (**rotational latency**)
 - **Head crash** results from disk head making contact with the disk surface

Parameter	IBM 360-KB floppy disk	WD 18300 hard disk
Number of cylinders	40	10601
Tracks per cylinder	2	12
Sectors per track	9	281 (avg)
Sectors per disk	720	35742000
Bytes per sector	512	512
Disk capacity	360 KB	18.3 GB
Seek time (adjacent cylinders)	6 msec	0.8 msec
Seek time (average case)	77 msec	6.9 msec
Rotation time	200 msec	8.33 msec
Motor stop/start time	250 msec	20 sec
Time to transfer 1 sector	22 msec	17 μ sec

Disk Structure

- Disks can be removable
- Drive attached to computer via **I/O bus**
 - Vary Buses, including EIDE, ATA, SATA, USB, Fiber Channel, SCSI
 - **Host controller** in computer uses bus to talk to **disk controller** built into drive or storage array

Disk Structure

- Disk drives are addressed as large 1-dimensional arrays of **logical blocks**, where the logical block is the smallest unit of transfer.
- The 1-dimensional array of logical blocks is mapped into the sectors of the disk sequentially.
 - **Sector 0** is the first sector of the first track on the outermost cylinder.
 - Mapping proceeds in order through that track, then the rest of the tracks in that cylinder, and then through the rest of the cylinders from **outermost to innermost**.

Outline

- Disk Structure
- **Disk Attachment**
- Disk Scheduling
- Disk Management
- Swap-Space Management
- RAID Structure
- Stable-Storage Implementation
- Tertiary Storage Devices

Disk Attachment

- Disks may be attached one of two ways
 - **Host attached** via an I/O port
 - **Network attached** via a network connection

Network-Attached Storage

Storage-Area Network

Outline

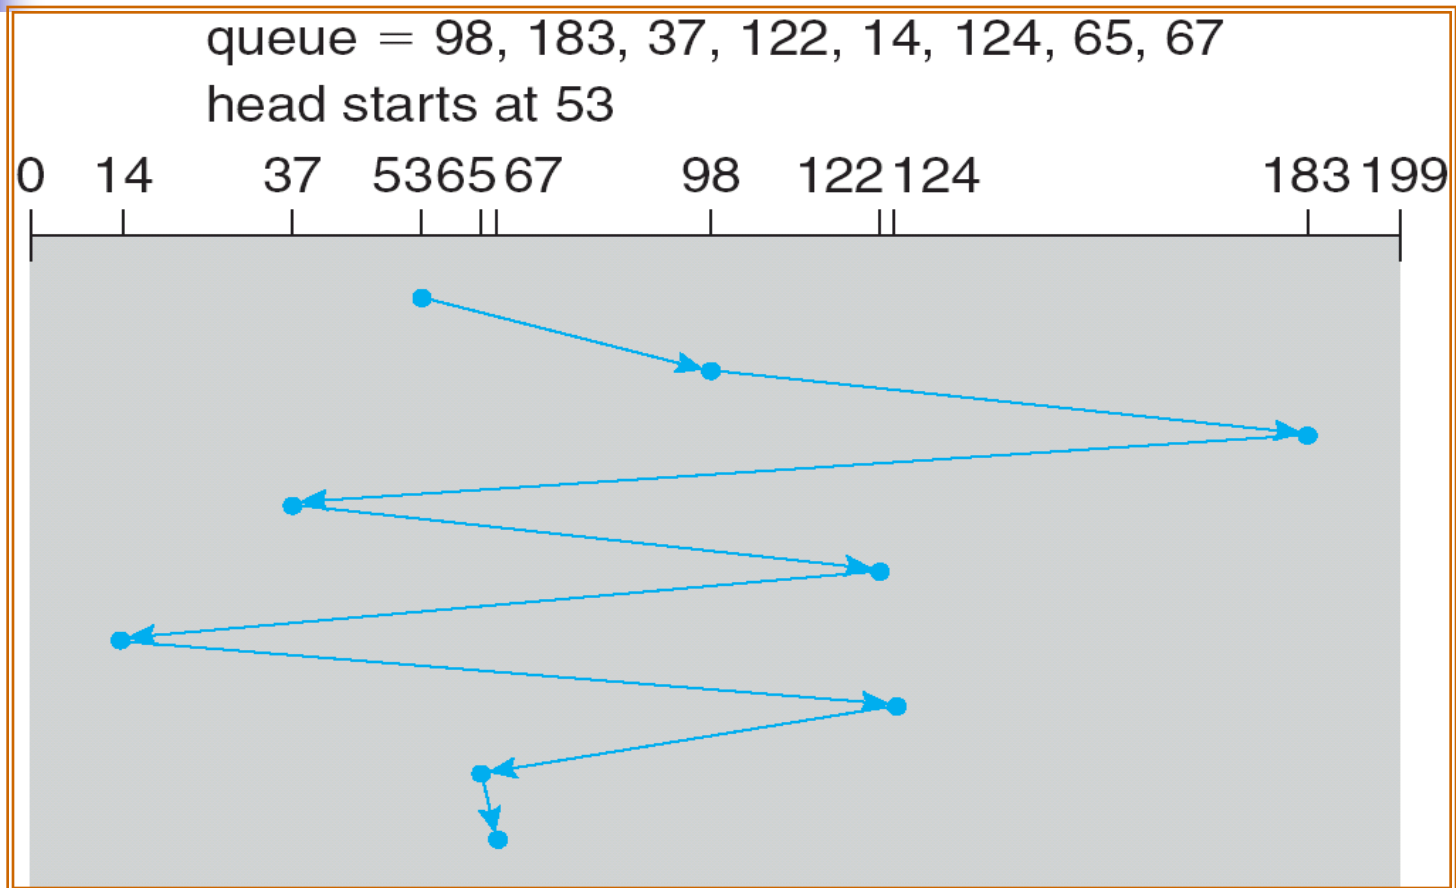

- **Disk Structure**
- **Disk Attachment**
- **Disk Scheduling**
- **Disk Management**
- **Swap-Space Management**
- **RAID Structure**
- **Stable-Storage Implementation**
- **Tertiary Storage Devices**

Disk Scheduling

- **Access time** has two major components
 - *Seek time* is the time for the disk are to move the heads to the cylinder containing the desired sector.
 - *Rotational latency* is the additional time waiting for the disk to rotate the desired sector to the disk head.
- **Disk bandwidth**
 - the total number of bytes transferred, divided by the total time between the first request for service and the completion of the last transfer.

FCFS

Seek Distance: total head movement of 640 cylinders

SSTF (Shortest Seek Time First)

- may cause starvation of some requests.
- total head movement of 236 cylinders

SCAN — elevator algorithm

- total head movement of 236 cylinders

C-SCAN

- Provides a more uniform wait time than SCAN.

C-LOOK

Selecting a Disk-Scheduling Algorithm

- **SSTF** is common and has a natural appeal
- **SCAN and C-SCAN** perform better for systems that place a heavy load on the disk.
- Either **SSTF or LOOK** is a reasonable choice for the default algorithm.
- Performance depends on the number and types of requests.
- Requests for disk service can be influenced by the file-allocation method.

Outline

- **Disk Structure**
- **Disk Attachment**
- **Disk Scheduling**
- **Disk Management**
- **Swap-Space Management**
- **RAID Structure**
- **Stable-Storage Implementation**
- **Tertiary Storage Devices**

Disk Formatting

- ***Low-level formatting, or physical formatting*** — Dividing a disk into sectors that the disk controller can read and write.

A disk sector

Disk Formatting

- To use a disk to hold files, the operating system still needs to record its own data structures on the disk.
 - ***Partition*** the disk into one or more groups of cylinders.
 - ***Logical formatting*** or “making a file system”.

Boot Block

- Boot block initializes system
 - The bootstrap is stored in **ROM**.
 - *Bootstrap loader* program.
- Booting from disk in Windows 2000

Error Handling

- A disk track with a bad sector
- Substituting a spare for the bad sector
- Shifting all the sectors to bypass the bad one

(a)

(b)

(c)

Outline

- Disk Structure
- Disk Attachment
- Disk Scheduling
- Disk Management
- **Swap-Space Management**
- RAID Structure
- Stable-Storage Implementation
- Tertiary Storage Devices

Swap-Space Management

- **Swap-space — Virtual memory uses disk space as an extension of main memory.**
- **Swap-space can be carved out of the normal file system, or, more commonly, it can be in a separate disk partition.**

Outline

- **Disk Structure**
- **Disk Attachment**
- **Disk Scheduling**
- **Disk Management**
- **Swap-Space Management**
- **RAID Structure**
- **Stable-Storage Implementation**
- **Tertiary Storage Devices**

RAID Structure

- **RAID – Redundant Array of Independent Disk (磁盘冗余阵列)**
 - multiple disk drives improves **reliability via redundancy** and **performance via parallelism**.
- RAID is arranged into six different levels.

RAID Levels

(a) RAID 0: non-redundant striping.

(b) RAID 1: mirrored disks.

(c) RAID 2: memory-style error-correcting codes.

(d) RAID 3: bit-interleaved parity.

(e) RAID 4: block-interleaved parity.

(f) RAID 5: block-interleaved distributed parity.

(g) RAID 6: P + Q redundancy.

Outline

- **Disk Structure**
- **Disk Attachment**
- **Disk Scheduling**
- **Disk Management**
- **Swap-Space Management**
- **RAID Structure**
- **Stable-Storage Implementation**
- **Tertiary Storage Devices**
